Backup&Recovery

Xopero ONE

Complete SharePoint Backup for Secure Teamwork

Protect sites, pages, files, lists, and other SharePoint Online resources in Microsoft 365. **Quickly restore data** and **ensure teamwork continuity.**

How Xopero ONE **Protects Your Organization's SharePoint**

Comprehensive SharePoint backup

Use Xopero ONE to protect the entire SharePoint ecosystem: from team sites, through pages, to shared files and widgets, including calendars and lists.

Flexible data recovery options

Restore SharePoint sites and resources to their original or a different location. You can also create an entirely new site to restore your backup.

Granular recovery of SharePoint items

Recover selected sites, pages, and files following accidental deletion or unintended changes. With Xopero ONE, you can quickly revert to the moment before a failure.

Complete Microsoft 365 security

Back up SharePoint alongside other key Microsoft 365 services such as Exchange (emails, calendars, contacts) and OneDrive (files and folders) to protect the whole organization against modern threats.

Why Do You Need SharePoint Backup?

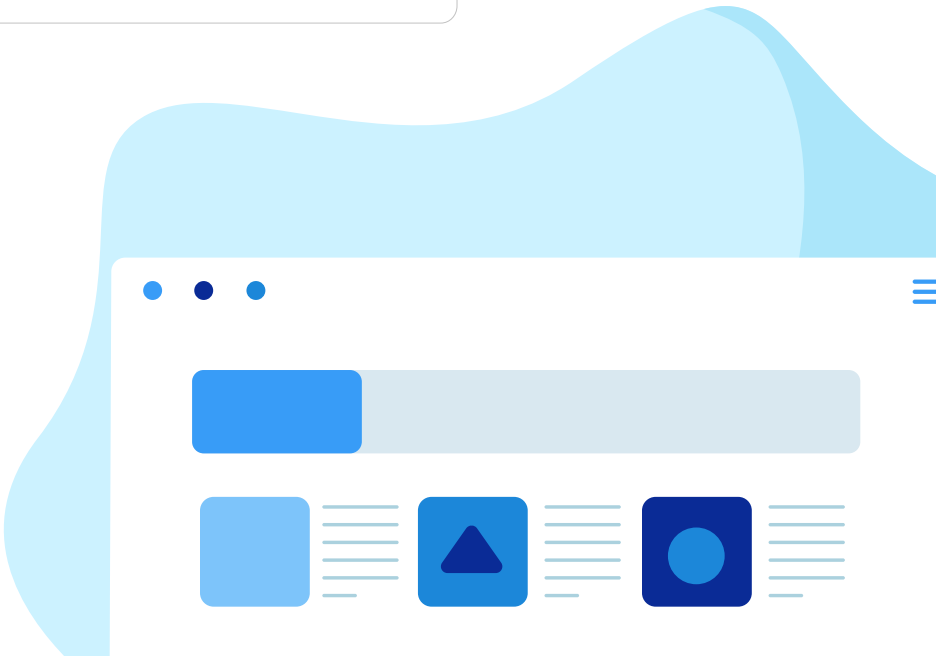

Cloud services (SaaS) - like Microsoft 365 - do not provide full protection for end-user data

Shared Responsibility Model
Microsoft guarantees service uptime, but isn't responsible for end users' data.

Microsoft's native backup
The tool has significant limitations, especially in terms of data retention and separation

External threats
Cloud services are not immune to external threats such as phishing, ransomware, etc.

Internal threats
SharePoint data can be deleted by mistake or maliciously by a M365 user (insider threats) and due to configuration errors.

Xopero ONE

Enterprise-grade, Comprehensive Backup Solution

More than just SharePoint backup

With Xopero ONE, you can protect the entire organization infrastructure: endpoints, servers, virtual machines, Microsoft 365, DevOps platforms, as well as Jira and Confluence.

On-premises and cloud storage

You can store SharePoint backups locally (NAS, SMB), in a cloud of your choice (AWS, Google Cloud, Wasabi) or in multiple locations at once, following the 3-2-1-1-0 backup rule.

End-to-end encryption

Xopero ONE supports highly secure AES encryption to protect SharePoint backup data at every stage: from reading in the source, through transit, to storage.

Ransomware protection

Take advantage of technologies such as non-executability and immutable backup to secure copies against tampering and encryption.

Task automation

Scheduler and backup window features let you regularly run SharePoint backups with no user intervention. With automated notifications and reports, you can monitor backup statuses and health in real time.

Unlimited retention

With Xopero ONE, you can store SharePoint backups **as long as you want** to comply with internal policies and industry regulations. No more problems with short-term retention of the native Microsoft backup.

Intuitive management

Xopero ONE web-based console lets you centrally manage backup jobs from anywhere. Encrypted HTTPS connection, MFA, and RBAC ensure that your security always remains second to none.

In-house support team

Xopero maintains a team of experienced technicians. Thanks to tight cooperation with the engineering team, you get the guarantee of robust product expertise and quick ticket resolution.
